

Abstract

A Universal Adjustable Equipment Mount used for mounting marine or other water-borne equipment to watercraft. The mount itself is can be affixed to the aft section of a boat or to the hardtop away from congested areas and clear of walkways. Slide brackets, held in place by a C-extrusion track, can be adjusted either up or down or laterally across the length of the C-extrusion. Ridges inside the C-extrusion operate as locks on the slide brackets and allow the user secure adjustment at any location selected. This offers complete versatility in movement and great versatility in accessory additions. Rod holders, lighting, or other accessories can be mounted on the slide brackets as desired. Mounting brackets, with a unique end-piece design, secures the entire assembly to the boat structure and serves as an adjustment mechanism for the C-extrusion track which furthers the overall adjustment of the unit.
